

Business bank credit facility line — customer transformation map (CTM), v2, at C2

Venture: the credit facility line of a large UK SME bank (Case B — term loan and overdraft), Path C mode 3 — see [../bank-credit-facility-c2-v1-2026-09-21.md](#). v2 written at R2 (21 Sep 2026), runner-drafted under the propose-and-confirm rule. v1

([bank-credit-facility-ctm-v1-2026-09-18.md](#)) is retained unchanged as the C1 record. Update mode: only the rows R2 adds or changes are new; every other row is carried from v1 with its C1 trace.

Customer at C2 (selected at R2): the established UK SME with observable account flow that currently pays a standard-tariff overdraft at 15–30% EAR for recurrent working-capital draws. Naming note: the challenge skill names the model file [bank-credit-facility-ctm-model-at-C2.yaml](#) and generates the views from it; this venture's pattern (C1) is a document, so this file is the record and the model file stays a build item — the runner's call, carried in the C2 record. Every state change is traced to a requirement by number; anything a later requirement owns is flagged `[REQUIRES C[N]+]`, not designed. The bank is not named. Every figure only the bank holds is a red field `[!]` `[description]`. Every `[!]` figure is Tier 4 until the insider corrects it.

Defined terms. As in v1: flow, standing limit, draw, receipts share, account line. New at C2: Standard tariff — the published interest rate and fees a bank charges on a business overdraft that is not individually negotiated. Migration — the one-time move of a customer's existing arranged overdraft, and any balance drawn on it, into the standing limit and a draw with a receipts share. Price condition — the rule that the all-in price of the limit per £1,000 drawn stays below the standard-tariff cost the customer paid before migration; a condition, not a price — the price and its structure are C6's.

1 · Component register (Flow Register format)

ID	Product	Component	Introduced at	Carries
WP-1	Working	the standing limit — computed from the flow by the limit engine, shown in the account, recomputed daily	C1	the customer's "I can see what I can draw" state; the bank's exposure decision, which no person makes
WP-2	Working	the draw — the customer moves money from the limit to the balance in the account, no application	C1	the customer's "I have the money" state
WP-3	Working	the receipts share — a term of the account agreement under which a fixed fraction of each receipt repays the drawn balance	C1	the customer's "it repays itself from what comes in" state; the bank's collections operation, which no longer exists as an operation

ID	Product	Component	Introduced at	Carries
WP-4	Working	the migration — the customer's existing arranged overdraft is retired and any drawn overdraft balance becomes a draw on the standing limit with a receipts share; one event per overdraft account; the customer may decline and keep the overdraft	C2	the customer's "the money I already owe now sits on the limit, at less than I was paying" state; the retirement of the standard-tariff overdraft as a product on the account
CP-1	Communications	the limit statement — the standing limit and the receipts share, visible in the account before any need arises	C1 (v2 amended at C2: the statement also shows, once a year, what the customer paid on the overdraft in the year before migration and what the limit cost in the year since)	the "aware" state (C1); the "I can see the saving" state (C2)
PC-1	Payment	the price condition — the all-in price of the limit per £1,000 drawn is held below the standard-tariff cost the customer paid before migration; a constraint the Payment product must satisfy	C2 (condition only)	the customer's "this costs me less than the overdraft did" state; the structure, the level and the presentation of the price are [REQUIRES C6]
—	Communications	how a customer who has never borrowed comes to trust the limit enough to draw	[REQUIRES C4+]	not designed
—	Payment	the price — the interest and any fee on the drawn balance, its structure and how it is presented	[REQUIRES C6]	not designed; PC-1 constrains it, nothing more
—	Partner	the accountant, the accounting software or the platform through which the customer meets the limit	[REQUIRES C7]	not designed
—	Working	the limit for an account with no flow history anywhere (new to trading)	excluded at C2 — recorded in the TAM data object as an excluded sub-class; no later requirement is named as its owner	not designed

2 · The customer's journey — the business (four phases)

Sparse states; a component sits on each transition; a transition with no component carries a flag.

Phase 1 — Becoming

From state	To state	Component	Change (cognitive / emotive / behavioural)	Requirement
holds an account and pays a standard-tariff overdraft for recurrent draws (the selected customer); or borrows nowhere, or is refused, or puts in personal money	aware that the account carries a standing limit	CP-1	cognitive	C1
aware	convinced the limit is real and the receipts share is bearable	— [REQUIRES C4+]	emotive	not designed at F1
convinced	draws for the first time (a customer with no overdraft); or accepts migration of the existing overdraft (the selected customer)	WP-2; WP-4	behavioural	C1; C2

Phase 2 — Consuming (core delivery — the phase R1 changed; R2 adds the value-realisation rows)

From state	To state	Component	Change	Requirement
needs working money this week	has the money in the account	WP-2 — the draw, within the standing limit, no application, no decision event	behavioural	C1
drawn	drawn balance falls as receipts arrive	WP-3 — the receipts share	behavioural (nothing to do)	C1
flow grows or shrinks	standing limit rises or falls	WP-1 — recomputed daily from the flow	cognitive	C1
flow stops	limit falls to zero; drawn balance stays; the exception cell contacts the customer	WP-1 and the exception activity (AOM 3b)	behavioural	C1

From state	To state	Component	Change	Requirement
pays the standard tariff on an arranged overdraft, renewed each year	the overdraft is retired; the drawn balance sits on the limit under a receipts share; no renewal, no fee event	WP-4	behavioural	C2
carries the drawn balance on the limit	sees, once a year, what the overdraft cost and what the limit cost — the saving is visible	CP-1 (amended)	cognitive	C2
carries the drawn balance on the limit	the all-in price stays below what the overdraft cost	PC-1 (condition); the price itself [REQUIRES C6]	emotive (relief from the tariff)	C2 — condition; C6 — price

Phase 3 — Paying (the phase R3 changes; the price is C6)

From state	To state	Component	Change	Requirement
drawn	pays interest on the drawn balance, taken with the receipts share	— [REQUIRES C6] — structure not designed; PC-1 bounds it from above	behavioural	not designed at F1

Phase 4 — Repeating

From state	To state	Component	Change	Requirement
cleared	draws again when needed; the limit was never withdrawn	WP-1	behavioural	C1
the business grows	the limit grows with the flow; no new application at any size below the form's ceiling	WP-1	cognitive	C1
a year on the limit	does not return to an overdraft — there is none to return to on this account	WP-4 (the overdraft was retired)	behavioural	C2; the switching cost this creates is R8's by number

3 · User and partner tracks (property holders who are not the customer — VA-71)

Account line track (the bank's own account, Case A) — internal holder, C1

State	Component	Holder	Note
the flow is observed and held as a record	the account ledger	the bank (the Kept design on Case A; a dependency, not designed here)	the limit engine reads the ledger
the receipts share is a term of the account agreement	WP-3	the bank's account terms; regulated under the Consumer Credit Act 1974 for a sole trader or a partnership of two or three persons borrowing under £25,000 (s.16B)	a compliance line, not a decision
the existing overdraft agreement is varied or replaced at migration	WP-4	the bank's product and conduct function	C2 — for a CCA-regulated customer, a modifying agreement or a new regulated agreement is needed (CCA 1974 s.82); for a limited company, a variation of terms with notice. Carried as a standing constraint

Limit engine track (the bank's own operators) — internal holder, C1

State	Component	Holder	Note
the limit is computed by a rule from the flow; no person decides an account	WP-1	the limit engine team and the model-risk reviewer (AOM 3c)	the rule is a model under SS1/23
an account whose flow stops is handled by a person	exception activity (AOM 3b)	the exception cell	the only human contact in the form
a customer declines migration, or queries the saving statement	exception activity (AOM 3b, C2 rows)	the exception cell	C2 — the customer keeps the overdraft; the account carries both until the overdraft's next renewal

Pricing track (the bank's own pricing function) — internal holder, new at C2

State	Component	Holder	Note
the price condition is set as a constraint on the Payment product	PC-1	the bank's pricing committee	C2 — the holder of "the price remains below the tariff" is the pricing committee, not the customer; the committee carries the condition; the price it sets is [REQUIRES C6]

Regulator track — C1, unchanged

State	Component	Holder	Note
the bank holds Part 4A permission to lend and accept deposits	—	PRA and FCA	no new permission; capital under the standardised approach

Partner track — flagged

State	Component	Holder	Note
who brings the customer to the limit	—	[REQUIRES C7]	not designed

4 · State changes traced to requirements (the traceability check)

State change	Component	Requirement	Status
refused or self-funding → aware of a standing limit	CP-1	C1	carried
aware → convinced	—	C4+	flagged
needs money → has money, no application	WP-2	C1	carried
drawn → repaid from receipts, no collections operation	WP-3	C1	carried
flow changes → limit changes	WP-1	C1	carried
flow stops → exception contact	AOM 3b	C1	carried
pays the tariff on an overdraft → the overdraft is retired and the balance sits on the limit	WP-4	C2	carried
on the limit → sees the saving once a year	CP-1 (amended)	C2	carried
on the limit → the price stays below the tariff	PC-1 (condition)	C2 (condition); C6 (price)	carried as a condition; the price is flagged
declines migration → keeps the overdraft	AOM 3b (C2 row)	C2	carried
drawn → pays a price	—	C6	flagged
no flow history → a limit	—	excluded (TAM data object)	recorded, not carried

Every C1 and C2 transition carries a component or a flag. No transition is carried by a component that a later requirement has not yet designed: PC-1 is a condition on the Payment product, not the product.

Component set at C2 (for the margin-of-safety check, VA-74): WP-1, WP-2, WP-3, WP-4, CP-1 (amended), PC-1 (condition).

Changelog

Version	Date	Change
v1	18 September 2026	Created at R1.
v2	21 September 2026	R2 update. Added WP-4 (migration), PC-1 (price condition) and the amended CP-1; three Phase 2 rows, one Phase 1 row, one Phase 4 row; the pricing track; the migration row on the account line track; the decline row on the limit engine track. The new-to-trading row is now an excluded sub-class in the TAM data object, not a [REQUIRES C2] flag.
